

Plugin Overview

BattleTracker is a standalone plugin that tracks PVP & PVE statistics along with a suite of combat features to enhance server gameplay.

BattleTracker tracks player statistics for both PVP and PVE combat. It also comes with a full suite of customizable features, such as death messages, combat logging, damage indicators and more. It also serves as the companion to [BattleArena](#), and handles keeping track of arena and competition statistics.

Features

PVP and PVE Records

One of the core features of BattleTracker is its robust tracking system for PVP and PVE statistics. BattleTracker tracks a variety of statistics including kills, deaths, killstreaks, and more. These statistics are saved in MySQL or SQLite, allowing them to be shared across Minecraft servers, or accessed by web applications.

Leaderboards

Another feature BattleTracker includes is a leaderboard system that allows players to view the top players on the server based on various statistics.

Death Messages

BattleTracker provides customizable death messages that can be displayed to players when they are killed in PVP or PVE combat. These are easily configurable for each tracker type, and can be customized to fit the theme of your server.

Damage Recap

BattleTracker also includes a damage recap feature that displays a summary of the damage dealt and received by a player during combat. This can be summarized in multiple ways, such as which

item dealt the most damage, a breakdown of players that dealt damage, or all the types of damage a player received.

Combat Logging

BattleTracker includes a combat logging feature that places players "in combat" when they attack another player. If they log out, they will be killed and their attacker will receive credit for the kill.

Damage Indicators

Inside BattleTracker, there is also support for damage indicators, which show to a player how much damage they inflicted on another player or entity.
